Jacky Alciné is a seasoned software engineer with a penchant towards the use and support of F/LOSS across one's working environments. You can view my profile on Microsoft's LinkedIn or download my resume. With both technical acumen and strong communication skills, I'm eager to expand a team or organization's ambitions using technology in a holistic, transparent and transformative way. **I'm immediately available for work** in various capacities — even consulting.

Skill Set

Languages: **Proficency**: TypeScript, JavaScript, Ruby, Python; **Familiarity**: PHP, C++ +(C++11/C++14), Rust, Clojure, Elixir

Technologies: **Proficient**: Express, Ruby on Rails; **Familiarity**: Hapi, Nest.js, Phoenix

Experience

Plural Policy

Senior Fullstack Web Engineer • **Feb 2024** to **May 2024** (+/- 4 months)

- Spent time contributing to ideation on the conceptual platform in regular feature lab sessions.
- Worked on assisting the migration of a Hapi server to Nest.js in the act of feature development.
- Contributed and guided code reviews for changes towards the Web platform.
- Assisted in the on-boarding of an engineer to the Node.js platform.

Code for America

Senior Software Engineer • **Nov 2022** to **Sept 2023** (+/- 11 months)

I joined the **Tax Benefits** team in order to help the effort of maintaining one of the flagship projects, Get Your Refund, an open-source Rails application meant to provide VITA volunteers and sites a means of helping people file for tax benefits.

- Spent lots of time pairing on Ruby code on features to distribute team's understanding of the product, speeding up our deployment times

- Wrote out documents around changes to the platform to help commodify understanding
- Spent time working on changes to help reduce noise of the maintaining of vita-min, written with Ruby on Rails.
- Held meetings explaining new changes made for support, deepening shared technical understanding.
- Integrated and deployed features based on feedback and inquiry • meetings and other product guidance in Ruby.

Eden Health

Senior Software Engineer • **Jan 2022** to **Aug 2022** (+/- 7 months)

After learning Clojure on the job, my main role was working on feature development on the core monolith of Eden Health, written in the same. While database work was done using SQLAlchemy, I dipped back and forth between codebases to make changes whenever necessary (and assisting teammates throughout the way). Some of these changes included expanding what registration options patients had in terms of linking insurances and other important quality of life improvements.

- Learned a working capacity of Clojure to immediately contribute to the core platform.
- Contributed core database alignment in the Python stack as it was kept separate from the core Clojure stack.
- Contributed documentation and guidelines for updating how patients were intending to register at portals, cutting down sign up time.
- Participated in internal brown bags around my experience using Clojure and Neovim.

Nava PBC

Software Engineer • **Dec 2020** to **June 2021** (+/- 7 months)

While at Nava, I worked mainly on helping the effort of delivering payments to those claiming benefits for those qualified by the Commonthwealth of Massachusetts (family leave and unemployment insurance, for example). Some of the work I got to focus on was developing the pipeline for said requests and helping insure integrity of the transactions over time. The logic for this work was done mainly using Python and AWS services.

- Worked on improving reliability of benefit requests with more automated testing and metrics collection.

- Contributed heavily to improving the developer experience for deploying PFML changes to Mass.
- Spent a lot of time contributing to code review with other teams.

Glitch

Software Engineer from **Aug 2019** to **May 2020** (+/- 10 months)

During my time on the Platform team at Glitch, I contributed to:

- Refactoring endpoints in the existing API system in TypeScript to support product development and stability
- Adding tooling to make internal project development easier
- Updated internal tools to make use of the newer API endpoints, powered by Node
- Extended how application placements from Glitch's internal mappings worked to the benefit of maintainability.
- Made changes to the React-based frontend for listing projects for users, namely around how boosted apps were presented.

I was impacted by layoffs at Glitch in 2020.

Lob

Senior Software Engineer from **Nov 2017** to **July 2018** (+/- 9 months)

- Improved PDF rendering of invoices for the billing system, long-requested feature of clients.
- Extended the capabilities of account administrations around configuring their billing options in the React frontend and Flask backend.
- Improved how integrations and the internal system were reconciled as part of a move to a different approach to billing (from an explicit tier-based system to a hybrid tier/usage-based one with grandparenting support).

Lyft

Software Engineer from **Jan 2017** to **September 2017** (+/- 9 months)

- Working on implementing a message templating system in Python and React to replace explicit calls to vendors to reach users, dramatically improving support's ability to help customers
- Added an interface in the internal system to manipulate said templates and make

them visible in user profiles, expanding marketing and internal translators abilities.
- Added adaptivity to said tooling to allow for users to adjust their channels for receiving information, increasing user privacy and control by also proxying messages and calls with the newly built service dubbed Switchboard. This added logic to help use less numbers when routing calls between users, saving Lyft money on routing costs across vendors.

Clef

Software Engineer from **November 2015** to **September 2016** (+/- 11 months)

- Maintained the Android SDK and Cordova SDK for mobile developers
- Improved in-flight requests by cutting down paths for users in authentication requests
- Moved our development environment to use more virtualization to speed up feature releases.
- Worked on the cross-platform mobile SDK for a new product feature, Instant 2FA

Shutterstock

Software Engineer from **Apr 2014** to **Dec 2014** (+/- 9 months)

- Was taught Perl to work and immediately contribute with the legacy platform.
- Contributed in the API migration from the legacy Perl stack to the Node platform.
- Maintained the acceptance suite for the newer Contributor product.
- Worked on extending a in-house CMS that drove the content marketing of the public facing Contributor site, reducing the need for a redeploy each time.

Consulting

I've worked with a range of clients on different kinds of software needs, stacks, languages and with different responsibilities - from fractional principal DevOps engineer to contract video system developer. My ability to jump in and get going is one that's kept me going and interesting in consulting. I begun my career consulting and always found it to be a good and exhilarating way to help people build the things they're envisioning and fix the problems that's been ailing them.

Companies I've consulted include the Electronic Frontier Foundation, Color of Change, Paddle8, Whose Your Landlord, BLS, Viridis Learning, Bareburger and Horizon Media.

My preferred working conditions for proposals and contracts:

- Include my daily rate of **USD $500** or hourly rate of **$60**. I optimize for hourly for short term (less than two months) role and daily for longer term contracts.
- A maximum of **four days worked per week** (for work-life balance).

The conditions above can be flexible provided good reason, market stability and personal welfare. **Please reach out** if you'd like me to work with you (or your organization).
